

Abstract of the Disclosure

A system and method for packaging a command string in an offline mode into a script, transmitting the script, and using a controller to read the script and send commands
5 and data to an individual device attached to the controller. The script may contain a header and one or more action and action payloads. When the script is interpreted by the controller, various commands and data may be passed directly to the individual device. Such a system may be useful for performing low level commands on the device, including loading firmware.
